

Pantra Ride App

Project Status Report - 2026-06-12

Project Overview

Pantra Ride App is a two-sided rideshare marketplace built for the Nigerian market. Riders book trips and drivers fulfil them, with NGN pricing and Paystack / Flutterwave payments. The app also includes an admin panel for operations management (user oversight, driver document review, marketing).

Platform: Android / iOS / Web (Expo React Native)

GitHub: [h](#)

Tech Stack

Layer	Technology
Framework	React Native 0.81.5, Expo 54, Expo Router 6
Language	TypeScript 5.9.2
State	Zustand 5.0.2
Auth & DB	Supabase (PostgreSQL + RLS)
Real-time	Firebase / Firestore
Maps	Google Maps API + Mapbox
Payments	Paystack, Flutterwave
Backend API	tRPC 11.5 + React Query 5.90
Notifications	Expo Notifications
Location	expo-location (foreground + background)
Testing	Vitest + Playwright

Feature Status Summary

Fully Working (20)

- Rider/driver signup, login, logout

- Adm

Partial (5)

- Payments - Paystack & Flutterwave (real backend integration, test keys only)

- Wal

Mock / UI-only (3)

- Promotions/promo codes (in-memory only)

- Driv

What's New This Session

1. Rider ride-status notifications

Riders now get local notifications mirroring the driver experience: "Driver Assigned", "Driver Arrived", "Ride Started", and "Ride Completed" (with fare). Wired into app/ride-progress.tsx's existing live-tracking logic, reusing pre-built NotificationService methods.

2. Saved Places now sync to Supabase

Home / Work / Favorites persist to a new saved_locations table for real accounts (lib/saved-locations-service.ts, hooks/useSavedLocationsStore.ts), preserving the home/work upsert behavior. The test-rider account keeps AsyncStorage.

3. Supabase setup fully verified and complete

All Supabase setup steps have been run and re-verified:

Check	Result
wallets table	PASS
ratings table	PASS
driver_documents table	PASS
saved_locations table	PASS
private 'documents' storage bucket	PASS
admin role for gabrielfanda8@gmail.com	PASS - role="admin"

The admin panel login now works, and all Supabase-dependent features (wallet, ratings, driver verification, saved places) are fully unblocked.

npm tsc --noEmit remains clean (same 11 pre-existing baseline errors, unrelated to this work). A small numbering bug in DEVLOG's Pending Work list (item 7 'EAS build setup' was mislabeled 8) was also fixed.

Remaining Pending Work

Item 1 is the next milestone now that all Supabase setup blockers are resolved.

- 1. End-to-end ride loop test** - two-device/account verification: rider books, driver gets notified and accepts, rider sees live tracking through to completion + rating + notifications. Also confirm logged-out deep links redirect properly. (NEXT MILESTONE)
- 2. Phone login OTP** - replace hardcoded '123456' with real Supabase phone auth or an SMS provider.
- 3. Promotions backend** - Supabase promo_codes table, server-side validation, and fare discount application.
- 4. Driver wallet/earnings** - decide Firebase vs Supabase as source of truth, build a real withdrawal flow.
- 5. Schedule a ride** - add persistence and reminder for scheduled rides.
- 6. Production secrets** - switch to live Paystack keys, set Mapbox token, set Flutterwave keys.
- 7. EAS build setup** - install eas-cli, run eas login and eas build:configure, produce a preview build for real-device testing.
